Patients treated with medication were more likely to remain in therapy compared to patients receiving treatment that did not include medication.

Using teletherapy may be more appealing to those reluctant to get treatment for opioid use disorders.

The increase in injection drug use has also contributed to the spread of infectious diseases including HIV and hepatitis C.

A study of claims data from a large commercial insurer from 2010-2017 found telemental health visits increased from 2,039 to 54,175.

The opioid epidemic cost the U.S. approximately $696 billion in 2018.
